TITLE OF INVENTION: Conjugates comprised of polymer and HIV gp41-derived peptides and
TITLE OF INVENTION: their use in therapy
FILE REPERENCE: TRM-004
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     APPLICAT: Trimeris, Inc.
TITLE OF INVENTION: Pharmaceutical composition for improved administration of HIV
TITLE OF INVENTION: gp41-derived peptides, and its use in therapy
FILE REFERENCE: TRM-003
CURRENT APPLICATION NUMBER: US/10/663,589
CURRENT HILING DATE: 2003-09-16
PRIOR PRIOR PILING DATE: 2002-09-27
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Length 36;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Length 36
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  IndelB
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          100.0%; Score 198; DB 4;

A new hybrid polypeptide with enhanced pharmacokinetic properties comprises enhancer sequence.

Disclosure; Page 45; 124pp; English.

The invention relates to hybrid polypeptides comprising enhancer peptide sequence linked to core polypeptides. The enhancer polypeptides are derived from various retroviral envelope (gp41) protein sequences, especially from HIV-1, HIV-2 and SIV. The enhancer peptides enhance the pharmacokinetic properties such as increasing the half-life of any core polypeptide that they are linked to. The core polypeptides are any polypeptide that may be introduced into a living system and that can function as a pharmacoligically useful peptide for the treatment or prevention of a disease. The core polypeptides are bioactive peptides selected from a growth factor, cytokine, differentiation factor, interlevent, interferon, colony stimulating factor, hormone or anglogenic

```
The present invention describes a modified anti-viral peptide (I)

comprising a peptide that exhibits anti-viral activity and a reactive

comprising a peptide that exhibits anti-viral activity and a reactive

group which is reactive with anino groups, hydroxyl groups, or thiol

groups on blood components to form stable covalent bonds. (I) has anti-

coils by inhibiting cell-cell fusion or free virus infection of the level of membrane fusion events between two or more entities, e.g.,

virus-cell or cell-cell, relative to the level of membrane fusion that

cocurs in the absence of the peptide. (I) is useful in the treatment of

patients who are suffering from viral infection, e.g. HIV, RSV, HBIV,

MeV, and SIV. (I) may be administred prophylactically to previously

uninfected individuals. This is useful in cases where an individual has

components of the blood, such as immunosity, serum albumin, red

lived components of the activity is extended for days to weeks.

Chis is due to improved stability in vivo and a reduced susceptibility to
                                                                                                                                                                                            ö
               infection and can be used in anti-viral and anti-fusogenic trearments. Sequences AAY88651-Y90055 represent core polypeptide fragments that can be used in the invention. Some sequences among those indicated also comprise enhancer fragments at terminal ends and form hybrid polypeptides
The peptides of the invention can be used for inhibiting viral
                                                                                                                                                                                            Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Long lasting fusion peptide inhibitor; viral infection; antiviral; antifusgenit; mobile blood component; measles virus; MeV; SIV; santian immunodeficiency virus; human parafultuenza virus; HPIV; RSV; human respiratory syncytial virus; human immunodeficiency virus; HIV.

The present invention describes a modified therapeutic peptide (I) comprising a therapeutically active amino acid region (III) and a reactive group (II) (e.g. succinimidyl and maleimido groups) attached to a less therapeutically active amino acid region (IV), which covalently bonds with amino/hydroxyl/thiol groups on blood components to form a peptidase stabilised therapeutic peptide composed of 3-50 amino acids. (I) are useful for modifying therapeutic peptides e.g. hormones, growth factors and neurotransmitters, to protect them from peptidase activity in vivo for the treatment of various disorders. Endogenous therapeutic peptides are not suitable as drug candidates as they require frequent administration due to rapid degradation by peptidases in the body. Modifying and attaching therapeutic peptides to albumin prevents or reduces the action of peptidases to increase length of activity (half life) and specificity as bonding to large molecules decreases the action uptake and interference with physiological processes. AMB90829 to AAB9241 represent peptides which can be used in the exemplification of the present invention
                                                                                                                                                                    ö

The hybrid polypeptide exhibits enhanced pharmacokinnetic properties relative to those exhibited by the core polypeptide when introduced into a living system. It is used to increase the in vitro or ex vivo half-life of the core polypeptide. The hybrid and core polypeptides can be used for modulating fusogenic events and intracellular processes involving coiledcoil peptide interactions. Other uses include preventing, treating and/or diagnosing disorders involving fusion events (e.g. modulation of neurotranmitter exchange and speries (e.g. bacterial infections) and viral infections that involve cell and/or virus-cell fusion (e.g. viral) infections that involve cell and/or virus-cell fusion (e.g. viral)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            infections caused by human immunodeficiency virus, respiratory syncytial virus, Epstein-Barr virus, hepatitis B virus, Mason-Pfizer virus and polio virus). The enhancer peptide sequence increases the half-life and reduces the clearance rate of therapeutic peptides, which increases their
                                                                                                                                                                                                                                                                                                                                                                           enhancer, antiviral; anti-HIV; virucide; hepatotropic; hybrid polypeptide; coiled-coil peptide interaction;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       New hybrid polypeptide, useful for preventing, treating and diagnosing e.g. viral infections, comprises an enhancer peptide linked to a core polypeptide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           efficacy and minimises the incidence and severity of adverse side effects. In addition, this increases the sensitivity of the diagnostic

The present sequence is a core polypeptide which may be linked to an enhancer peptide to form a novel hybrid polypeptide. The hybrid polypeptide exhibite enhanced pharmacokinetic properties relative to those exhibited by the core polypeptide when introduced into a living system. It is used to increase the in vitro or ex vivo half-life of the core polypeptide. The hybrid and core polypeptides can be used for modulation glusgemic events and intracellular processes involving coiled-coil peptide interactions. Other uses include preventing, treating and/or diagnosing disorders involving fusion events (e.g. modulation of neurotransmitter exchange and spear-egg fusion), intracellular processes involving coiled-coil peptides (e.g. bacterial infections) and viral infections caused by human immunodeficiency virus, respiratory syncytial virus, Epstein-Barr virus, hepatide sequence increases the half-life and reduces the clearance rate of therapeutic peptides, which increases their effects. In addition, thus increases the sensitivity of adverse side effects.
                                                                                                                                                                                                                                                 Core polypeptide, enhancer, antiviral, anti-HIV, virucide, hepatotropic, antiinflammatory, hybrid polypeptide, coiled-coil peptide interaction; fusion-related disorder; bacterial infection, viral infection.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        New hybrid polypeptide, useful for preventing, treating and diagnosing e.g. viral infections, comprises an enhancer peptide linked to a core polypeptide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps

The invention relates to methods of generating immunogens that elicit neutralising antibodies which target regions of viral envelope proteins such as the gp120/gp1 (gjvcoprotein 120/gjvcoprotein 41) complex of HIV-
1 (human immunodeficiency virus 1). Sequences Adv70179-Adv70198 and
Adv70677-Adv70743 represent stabilising peptides modelling the alpha-
1 (human immunodeficiency virus 1). Sequences Adv70179-Adv70198 and
Adv70677-Adv70743 represent stabilising peptides modelling the alpha-
1 chalical regions of the ectodomain of the HIV-1 transmembrane protein to stabilise fusion-active intermediate structures, which can be used as vaccine immunogens. Immunogens compositions comprise a viral envelope protein or its fragment exterior to the viral membrane, a stabilising peptide to disrupt formation of structural intermediates necessary for viral fusion and entry, and optionally, a viral cell surface receptor or its fragment to form a stabilised, fusion active structure. Antibody binding assays are used to determine the ability of immunogen vaccines to generate an immune response to various forms of ervelope. Virus neutralisation assays can be used to characterise the antibody response raised against HIV-1 gp41 domains. The sequences and methods are useful for inhibiting HIV infection, for inducing an immune very.
                                                                                                                                                                 Human, HIV-1, human immunodeficiency virus; gp41; glycoprotein 41; gp120;

(RSV) infection in a cell. They may also be used to inhibit HIV infection. The present sequence is a peptide provided in the specification. (Updated on 06-AUG-2003 to correct OS field.) (Updated on 11-SEP-2003 to standardise OS field)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The invention relates to isolated analogues of the heptad repeat region peptides DP178 and DP107 correspond to amino acids 638-673 (heptad repeat region HR2) and 558-595 (heptad repeat region HR1) respectively, of HIV-LIAI transmembrane protein gp41. The HR1 and HR2 regions of proteins interact non-covalently with each other and/or with peptides derived from them. This interaction is required for normal infectivity of viruses such as RSV and HIV. The heptad region peptide analogues may be used to inhibit respiratory syncytial virus (RSV) infection in a cell. They may also be used to inhibit HIV
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Heptad repeat region peptide analogs useful for inhibiting virus/cells fusion, useful for treating HIV and Respiratory Syncytial Virus

                                                                                                                                                                                                                                                                                                                                                                         ö
                                                                                                                                                                                              The invention relates to isolated analogues of the heptad repeat region peptides DB178 and DB107. DP178 and DB107 correspond to amino acids 638-673 (heptad repeat region HR2) and 558-595 (heptad repeat region HR1) respectively, of HIV-LIAI transmembrane protein gp41. The HR1 and HR2 regions of proteins interact non-covalently with each other and/or with peptides derived from them. This interaction is required for normal infectivity of viruses such as RSV and HIV. The heptad repeat region, peptide analogues may be used to inhibit respiratory syncytial virus (RSV) infection in a cell. They may also be used to inhibit HIV specification. Updated on 06-MUG-2003 to correct OS field.) (Updated on 11-SEP-2003 to standardise OS field)
                                                                                                                                      Heptad repeat region peptide analogs useful for inhibiting virus/cells fusion, useful for treating HIV and Respiratory Syncytial Virus
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Human immunodeficiency virus, HIV; respiratory syncytial virus; RSV; virucide, heptad repeat region; transmembrane protein; gp41; HR1; HR2;

The invention relates to isolated analogues of the heptad repeat region peptides DP178 and DP107 correspond to amino acids 638-673 (heptad repeat region HR2) and 558-555 (heptad repeat region HR1) respectively, of HIV-liA1 transmembrane protein gp41. The HR1 and HR2 regions of proteins interact non-covalently with each other and/or with peptides derived from them. This interaction is required for normal infectivity of viruses such as RSV and HIV. The heptad repeat region peptide analogues may be used to inhibit respiratory syncytial virus (RSV) infection in a cell. They may also be used to inhibit HIV september of the sequence is a peptide provided in the specification. (Updated on 06-AUG-2003 to correct OS field.) (Updated on 11-SEP-2003 to standardise OS field)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Identifying a compound that inhibits the formation of or disrupts a DP107/DP178 complex, especially compounds with antifusogenic, antiviral or intracellular modulatory activity, by detecting the formation of a DP107/DP178 complex.
                                                                                                                                                                                                                                              Heptad repeat region peptide analogs useful for inhibiting virus/cells fusion, useful for treating HIV and Respiratory Syncytial Virus
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Anti-retroviral; DP178-like; DP107-like; transmembrane protein gp41; antifusogenic; antiviral; HIV transmission; mutant; mutein.

                                                                                                                                                                                                                                                                                                                                                       à
                                                                                                                                                                                                                                                                                                                                                                                셤
                                                                              amino acids 639-673 of the transmembrane protein gp41 from human immunodeficiency virus 1 (HIV-1) isolate LAI. The DP107 peptide corresponds to amino acids 558-555 of gp41 from HIV-LIAI. The invention also relates to a method of identifying compounds that inhibit the formation of or disrupts a DP107/DP178 complex. The method comprises detecting the formation of a DP107/DP178 complex, both in the presence of a test compound, in a reaction mixture containing DP107 and DP178 peptides. The method is useful for identifying compounds, including small molecule compounds, which may themselves exhibit antifusogenic, antiviral or intracellular modulatory activity. The DP178-like/DP107-like peptides are useful to inhibit human and non-human retroviral, particularly HIV, transmission to uninfected cells. The present sequence represents one of the DP178-like/DP107-like peptides of the invention
                                                                                                                                                                                                                                                                                                                                                       ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Identifying a compound that inhibits the formation of or disrupts a DP107/DP178 complex, especially compounds with antifusogenic, antiviral or intracellular modulatory activity, by detecting the formation of a
                                       The present invention relates to peptides which exhibit anti-retrovir activity. The peptides of the invention (AAU12559-AAU14009) comprise DP178-like and DP107-like peptides. The DP178 peptide corresponds to
                                                                                                                                                                                                                                                                                                                                                       Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Anti-retroviral; DP178-like; DP107-like; transmembrane protein gp41; antifusogenic; antiviral; HIV transmission; mutant; mutein.
                                                                                                                                                                                                                                                                                                                                                       ;

DP107/DP178 Acomplex:

```
The present invention relates to peptides which exhibit anti-retroviral activity. The peptides of the invention (AAU12559-AAU14009) comprise DP178-like and DP107-like peptides. The DP178 peptide corresponds to amino acids 639-673 of the transmembrane protein gp41 from human immunodeficiency virus I (HIV-1) isolate LAI. The DP107 peptide corresponds to amino acids 558-595 of gp41 from HIV-LIAI. The Invention also relates to a method of identifying compounds that inhibit the formation of or disrupts a DP107/DP178 complex. The method comprises detecting the formation of a DP107/DP178 complex, both in the presence or a test compound, in a reaction mixture containing DP107 and DP178 peptides. The method is useful for identifying compounds, including small molecule compounds, which may themselves exhibit antifusogenic, antivital or intracellular modulatory activity. The DP178-like/DP107-like peptides are useful to inhibit human and non-human retroviral, particularly HIV, transmission to uninfected cells. The present sequence represents one of the DP178-like/DP107-like peptides of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The present invention relates to a method of treating an HIV infection in an individual, which involves administering in combination a chemokine co-receptor 5 (CCR5) antagonist or its salt and a DP-178 polypeptide or its derivative. Other viral infections can also be treated using the method. The present sequence is a peptide derived from HIV and useful in the method of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Treatment of HIV infection in an individual involves administration of a combination of chemokine co-receptor five antagonist and a specified HIV envelope polypeptide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Viral infection; HIV; antiviral; DP-178; CCR5 antagonist; T-20; DP-107;

```
The invention relates to a novel hybrid polypeptide comprising an enhancer peptide sequence linked to a core polypeptide. The enhancer peptide sequence comprises WGSWEGKI or WASLWEWF. The invention also includes novel peptides that exhibit anti-fusogenic activity, antiviral activity and/or ability to modulate intracellular processes. The novel which polypeptide has virucide and antidiabetic activity. The enhancer peptide sequence enhances pharmacokinetic properties of any core.

Thy peptide, for example, a polypeptide useful for the treatment or prevention of a disease, or an imaging agent useful for imaging structures in vivo. The core polypeptide and hybrid polypeptides are useful for modulating fusogenic events and exhibit antifusogenic or antiviral activity. The novel hybrid polypeptide is useful for decreasing viral infection and modulating intracellular processes involving coiledcoil peptide interactions. The novel hybrid polypeptide is useful for antiorating the symptoms of forms of diabetes. The novel hybrid polypeptide is also or is symptoms of forms of diabetes. The novel hybrid polypeptide is also the core polypeptide is useful for antiorating the symptoms of forms of diabetes. The novel hybrid polypeptide is also events and viral infection that involves cell-cell and/or virus-cell fusion, and for diagnosis and in vivo imaging methods. This sequence the represents an enhancer peptide of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        New hybrid polypeptide for modulating fusogenic events for e.g. antiviral activity, has enhancer peptide sequence derived from retroviral envelope protein sequences linked to core polypeptide e.g. therapeutic protein.
                                                                       Gaps
                                                                                                                                                                                                                                                                                                                                                                   Hybrid polypeptide pharmacokinetic enhancer peptide, SEQ ID No 1357.

The invention relates to a novel hybrid polypeptide comprising an enhancer peptide sequence linked to a core polypeptide. The enhancer peptide sequence comprises WGEWEQKI or WASLWEWF. The invention also includes novel peptides that exhibit anti-fusogenic activity, antiviral activity and/or ability to modulate intracellular processes. The novel bybrid polypeptide has virucide and antidiabetic activity. The enhancer peptide sequence enhances pharmacokinetic properties of any core peptide sequence enhances plarmacokinetic properties of any core copypeptide, for example, a polypeptide useful for the treatment or prevention of a disease, or an imaging agent useful for imaging are tructures in vivo. The core polypeptide and hybrid abilypeptides are useful for modulating fusogenic events and exhibit antifusogenic creativity. The novel hybrid polypeptide is useful for decreasing critical infection and modulating intracellular processes involving coiledcoil peptide interactions. The novel hybrid polypeptide comprises insulin or its fragment, so the core polypeptide is useful for ameliorating the symptoms of forms of diabetes. The novel hybrid polypeptide is also call peptide interaction that involves cell and/or virus-cell and viral infection that involves cell-cell and/or virus-cell tusion, and for diagnosis and in vivo imaging methods. This sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              New hybrid polypeptide for modulating fusogenic events for e.g. antiviral activity, has enhancer peptide sequence derived from retroviral envelope protein sequences linked to core polypeptide e.g. therapeutic protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Disclosure; SEQ ID NO 1223; 70pp; English.

                                                                                                                                                                                                                                                                                 The invention relates to inhibiting (M) transmission of an Epstein-Barr virus to a cell, comprising contacting the cell with an effective concentration of a peptide consisting of a region of 16-39 consecutive amino acids of an Epstein-Barr virus potein for an effective period of time, where the region is recognised by one or more of AliMoTI5, 107x1784 or PLZIP sequence search motifs, the peptide further comprises an amino terminal X, and a carboxy terminal Z in which X comprises an amino group, acetyl group, 9-fluorenylmethoxy-carbonyl group, hydrophobic group, amido group, hydrophobic group, or macromolecular carrier group, and acaboxy is maind group, and is inhibited. The peptides were described the virus to the cell is inhibited. The peptides were
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             identified by analysing the structure/motifs present in the HIV-1 glycoprotein 41 anti-HIV peptides DP107 and DP178. These heptad repeat motif containing peptides were used to design the motifs cited above, which in turn were used to analyse proteins from other pathogenic organisms and HIV isolates, looking for DP107/178 structural analogues. The method is useful for inhibiting transmission of Epstein-Barr virus to a cell and Epstein-Barr virus infection. The present sequence is a control peptide used in the study of the DP178 stucture. (Updated on 23-OCT-2003 to standardise OS field)
Inhibiting transmission of Epstein-Barr virus to a cell, by contacting the cell with a peptide consisting of a region of Epstein-Barr virus
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Sequence 3,

Computer search generated synthetic peptides - are inhibitors of HIV transmission.

Example, Fig 1; 182pp; English

This peptide is isolated from HIV-1 isolate RF, and is a homologue of the peptide DP-178. DP-178 corresponds to amino acids 638 to 673 of the HIV-1 isolate LAI transmembrane protein gp41. It forms a putative alpha helix at the C-terminal end of the gp41 ectodomain, and complexes with DP-107 (corresponds to amino acids 558-595) which contains a leucine zipper motif. The peptides complex via non-covalant protein-protein interactions, and possess anti-viral activity. The peptide inhibits transmission to uninfected cells, and can also be used as type and/or subtype specific diagnostic tools. (Updated on 25-MAR-2003 to correct PN

```
AAW17012-W17016 are DP-178 homologues that are useful in the treatment of HIV infection. DP-178 is a peptide corresponding to residues 638-673 of HIV type 1 glycoprotein 41 (gp41) transmembrane protein. DP-178 and its derivatives/homologues are used in combination with a therapeutic agent, e.g a reverse transcriptase, viral protease, cytckine, glycosylation or viral mRNA processing inhibitor or a nucleoside inhibitor. The peptides work by inhibiting viral replication or inhibiting transmission. They may also be used in vaccines for protecting against HIV infection. (Updated on 17-OCT-2003 to standardise OS field)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Compsns. contg. DP-178 or DP-107 in combination with other therapeutic agent - useful for treatment of HIV infection, esp. by inhibiting replication or transmission of HIV.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Long lasting fusion peptide inhibitor; viral infection; antiviral; antifusogenic; mobile blood component; measles virus; MeV; SIV; simian immunodeficiency virus; human parainfluenza virus; HPIV; RSV; human respiratory syncytial virus; human immunodeficiency virus; HIV.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The sequences given in AAR98398-408 represent peptides which exhibit antifusogenic activity, antiviral capability and/or the ability to modulate intracellular processes involving coiled-coil peptide structures. These peptides are recognised by the ALMOTIS, 107x178x4 and PLZIP search motifs. These peptides may be used to inhibit the transmission of a virus, pref. HIV, influenza virus, or hepatitis B virus, to a cell. (Updated on 16-OCT-2003 to standardise OS field)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Inhibiting viral transmission, e.g. HIV or RSV, to a cell - using an isolated peptide recognised by an ALLMOTIS, 107x178x4 or PLZIP sequence search motif.

The present invention describes a modified anti-viral peptide (I) comprising a peptide that exhibits anti-viral activity and a reactive comprising a peptide that exhibits anti-viral activity and a reactive group which is reactive with amino groups, hydroxyl groups, or thiol groups on blood components to form stable covalent bonds. (I) has anti-viral and anti-fusogenic activities. (I) inhibits viral infection of cells by inhibiting cell-cell fusion or free virus infection or to reduce the level of membrane fusion events between two or more entities, e.g., virus-cell or cell-cell, relative to the level of membrane fusion that occurs in the absence of the peptide. (I) is useful in the treatment of patients who are suffering from viral infection, e.g. HIV, RSV, HPIV, MeV, and SIV. (I) may be administered prophylactically to previously uninfected individuals. This is useful in cases where an individual has been subjected to a high risk of exposure to a virus. By bonding of longlycen components of the blood, such as immunoplobin, serum albumin, red blood cells and platelets the activity is extended for days to weeks. This is due to improved stability in vivo and a reduced susceptibility to peptidase or protease degradation. This minimises the need for more frequent, or even continual, administration of the peptides. AAB54794 to AAB5431 represent peptides used in the exemplification of the present invention. AAB92246 standard; peptide; 36

(first entry) 22-JUN-2001

Virus related peptide SEQ ID NO:1422

Protection, endogenous therapeutic peptide, peptidase, conjugation, blood component, modification, succinimidyl, maleimido group, amino, hydroxyl, thiol; hormone, growth factor, neurotransmitter.

Homo sapiens Synthetic

```
comprising a therapeutically active amino acid region (III) and a reactive group (II) (e.g. succinimidyl and maleimido groups) attached to a less therapeutically active amino acid region (III) and a relative group (II) (e.g. succinimidyl and maleimido groups) attached to bonds with amino/hydroxyl/thiol groups on blood components to form a peptidase stabilised therapeutic peptide composed of 3-50 amino acids.

(I) are useful for modifying therapeutic peptides e.g. hormones, growth factors and neurotransmitters, to protect them from peptidase activity in vivo for the treatment of various disorders. Endogenous therapeutic peptides are not suitable as drug candidates as they require frequent administration due to rapid degradation by peptidases in the body. Modifying and attaching therapeutic peptides to albumin prevents or reduces the action of peptidases to increase length of activity (half life) and appecificity as bonding to large molecules decreases
                                                                                                                                                                                                                                                                                                           Modifying and attaching therapeutic peptides to albumin prevents peptidase degradation, useful for increasing length of in vivo activity.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gape
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  intracellular uptake and interference with physiological processes. AAB90829 to AAB92441 represent peptides which can be used in the exemplification of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                          The present invention describes a modified therapeutic peptide (I)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö
                                                                                                                                                                                                                                 Thibaudeau K;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Length 36;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Indels

polypepture exhibited by the core polypeptide when introduced into a living system. It is used to increase the in vitro or ex vivo half-life of the core polypeptide when introduced into a living system. It is used to increase the in vitro or ex vivo half-life of the core polypeptides can be used for modulating fusions: other uses include preventing, treating coiled agnoshing disconserved by the coiled peptide interactions. Other uses include preventing, treating and/or call peptide interactions of the uses include preventing, treating and/or neurotransmitter exchange and sperm-egg fusion), intracellular processes involving coiled-coil peptides (e.g. bacterial infections) and viral infections that involve cell-cell and/or virus. cespiratory syncytial virus, Epstein-Barr virus, hepatitis B virus, Mason-Pfizer virus and creduces the clearance rate of therapeutic peptides, which increases their efficacy and minimises the incidence and severity of adverse side effects. In addition, this increases the sensitivity of the diagnostic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Human, HIV-1; human immunodeficiency virus; 9041; 9lycoprotein 41; 9p120
anti-HIV; stabilising peptide; viral envelope protein; 9lycoprotein 120;
alpha-helical region; ectodomain.
                       New hybrid polypeptide, useful for preventing, treating and diagnosing e.g. viral infections, comprises an enhancer peptide linked to a core
                                                                                                                                                                          The present sequence is a core polypeptide which may be linked to an enhancer peptide to form a novel hybrid polypeptide. The hybrid polypeptide exhibits enhanced pharmacokinetic properties relative to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     HIV viral envelope protein stabilising peptide #3.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö
                                                                                                                                                                                                                                                                                                               The present sequence is a core polypeptide which may be linked to an polypeptide captide to form a novel hybrid polypeptide. The hybrid polypeptide exhibits enhanced pharmacokinetic properties relative to those exhibited by the core polypeptide when introduced into a living system. It is used to increase the in vitro or ex vivo half-life of the modulating fusogenic events and intracellular processes involving coiledcoil peptide interactions. Other uses include preventing, treating and/or diagnosing disorders involving fusion events (e.g. modulation of diagnosing that exchange and sperm-egg fusion), intracellular processes involving coiled-coil peptides (e.g. bacterial infections) and viral infections that involve cell-cell and/or virus, respiratory syncytial infections caused by human immunodeficiency virus, respiratory syncytial
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 virus, Epstein-Barr Virus, hepatitis B virus, Mason-Ffizer virus and pollo virus). The enhancer peptide sequence increases the half-life and reduces the clearance rate of therapeutic peptides, which increases their efficacy and minimises the incidence everity of adverse side effects. In addition, this increases the sensitivity of the diagnostic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Core polypeptide; enhancer; antiviral; anti-HIV; virucide; hepatotropic; antiinflammatory; hybrid polypeptide; coiled-coil peptide interaction; fusion-related disorder; bacterial infection; viral infection.
                                                                                                                                                               New hybrid polypeptide, useful for preventing, treating and diagnosing e.g. viral infections, comprises an enhancer peptide linked to a core
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps

                                         neutralising antibodies which target regions of viral envelope proteins such as the gpl20/gp41 (glycoprotein 120/glycoprotein 41) complex of HIV-
1 (human immunodeficiency virus 1). Sequences Auv70179-Auv70198 and
Auv70677-AAUv7043 represent stabilising peptides modelling the alpha-
helical regions of the ectodomain of the HIV-1 transmembrane protein to
stabilise fusion-active intermediate structures, which can be used as
vaccine immunogens. Immunogens expressions comprise a viral envelope
protein or its fragment exterior to the viral membrane, a stabilising
peptide to disrupt formation of structural intermediates necessary for
viral fusion and entry, and optionally, a viral cell surface receptor or
its fragment. The stabilising peptide is capable of associating with the
structure. Antibody binding assays are used to determine the ability of
immunogen vaccines to generate an immune response to various forms of
envelope. Virus neutralisation assays can be used to characterise the
antibody response raised against HIV-1 gp41 domains. The sequences and
methods are useful for inhibiting HIV infection, for inducing an immune

ö
respectively, of HIV-ILAI transmembrane protein gp41. The HR1 and HR2 respectively, of HIV-ILAI transmembrane protein gp41. The HR1 and HR2 regions of proteins interact non-covalently with each other and/or with peptides derived from them. This interaction is required for normal infectivity of viruses such as R8V and HIV. The heptad repeat region peptide analogues may be used to inhibit respiratory syncytial virus (RSV) infection in a cell. They may also be used to inhibit HIV infection. The present sequence is a peptide provided in the specification. (Updated on 06-AUG-2003 to correct OS field.) (Updated on 11-SEP-2003 to standardise OS field)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The invention relates to isolated analogues of the heptad repeat region peptides DP178 and DP107. DP178 and DP107 correspond to amino acids 638-633 (heptad repeat region HR2) and 558-595 (heptad repeat region HR1) respectively, of HIV-LIAI transmembrane protein gp41. The HR1 and HR2 regions of proteins interact non-covalently with each other and/or with peptides derived from them. This interaction is required for normal infectivity of viruses such as RSV and HIV. The heptad repeat region peptide analogues may be used to inhibit respiratory syncytial virus (RSV) infection in a cell. They may also be used to inhibit HIV specification. The present sequence is a peptide provided in the specification. (Updated on 06-NUG-2003 to correct OS field.) (Updated on 11-SEP-2003 to standardise OS field.)

DP178 and DP107 correspond to amino acids 638-673 (heptad repeat region HR2) and 558-595 (heptad repeat region HR1) respectively, of HIV-LIAI transmembrane protein gp41. The HR1 and HR2 regions of proteins interact non-covalently with each other and/or with peptides derived from them. This interaction is required for normal infectivity of viruses such as R8V and HIV. The heptad repeat region peptide analogues may be used to inhibit respiratory syncytial virus (R8V) infection in a cell. They may also be used to inhibit HIV infection. The present sequence is a peptide provided in the specification. (Updated on 11-SEP-2003 to standardise OS field)
                                                                                                                                                                                                                                                                                                                                                    Human immunodeficiency virus, HIV; respiratory syncytial virus; RSV;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The invention relates to isolated analogues of the heptad repeat region peptides DP178 and DP107 correspond to amino acids 638-673 (heptad repeat region HR2) and SS8-595 (heptad repeat region HR1) respectively, of HIV-LLAI transmembrane protein gp41. The HR1 and HR2 regions of proteins interact non-covalently with each other and/or with peptides derived from them. This interaction is required for normal infectivity of viruses such as RSV and HIV. The heptad repeat region peptide analogues may be used to inhibit respiratory syncytial virus (RSV) infection in a cell. They may also be used to inhibit HIV specification. The present sequence is a peptide provided in the specification. (Updated on 06-AUG-2003 to correct OS field.) (Updated on 11-SEP-2003 to standardise OS field)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Heptad repeat region peptide analogs useful for inhibiting virus/cells fusion, useful for treating HIV and Respiratory Syncytial Virus infection.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gape

The present invention relates to peptides which exhibit anti-retroviral activity. The peptides of the invention (AAU12559-AAU14009) comprise DP178-like and DP107-like peptides. The DP178 peptide corresponds to amino acids 639-673 of the transmembrane protein gp41 from human immunodeficiency virus i (HIV-1) isolate LAI. The DP107 peptide corresponds to amino acids 558-595 of gp41 from HIV-LIAI. The invention also relates to a method of identifying compounds that inhibit the formation of a disrupts a DP107/DP178 complex, both in the presence of a test compound, in a reaction mixture containing DP107 and absence of a test compound; which may themselves exhibit antifusogenic, antiviral or intracellular modulatory activity. The DP178-like/DP107-like peptides are useful to inhibit human and non-human retroviral, particularly HIV, transmission to uninfected cells. The present sequence represents one of the DP178-like/DP107-like peptides of the invention
                                                                                                                                                                                                                                                                                              107/DP178 complex, especially compounds with antifusogenic, antiviral intracellular modulatory activity, by detecting the formation of a

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The invention relates to isolated analogues of the heptad repeat region peptides DP178 and DP107 correspond to amino acids 638-673 (heptad repeat region HR2) and 558-595 (heptad repeat region HR1) respectively, of HIV-LIAI transmembrane protein gp41. The HR1 and HR2 regions of proteins interact non-covalently with each other and/or with peptides derived from them. This interaction is required for normal infectivity of viruses such as RSV and HIV. The heptad repeat region peptide analogues may be used to inhibit respiratory syncytial virus (RSV) infection in a cell. They may also be used to inhibit HIV
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                infection. The present sequence is a peptide provided in the specification. (Updated on 06-AUG-2003 to correct OS field.) (Updated on 11-SEP-2003 to standardise OS field)
                                                                                                           Human immunodeficiency virus; HIV; respiratory syncytial virus; RSV;

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

C. Accession: T06233
R. Stirewalt, V.L.; Michalowski, C.B.; Luffelhardt, W.; Bohnert, H.J.; Bryant, D.A.
Bubmitted to the EMBL Data Library, July 1995
A. Description: Nucleotide sequence of the cyanelle genome from Cyanophora paradoxa.
A. Reference number: 215840
A. Accession: T06923
A. Statuus: preliminary; translated from GB/EMBL/DDBJ
A. Molecule type: DNA
A. Residues: 1-49 < STI>
A. Cross-references: UNIPROT: P48367; UNIPARC: UP1000013A441; EMBL: U30821; NID: G1016083; PI
A. Experimental source: strain Pringsheim LBSSS
